

Eswatini's Top Technics expands with Bell Loggers and Skogger

When Cedusizi Dlamini wanted to start his own forestry contract harvesting business, he turned down a lucrative loan offer from a family member as he didn't want to risk any disharmony in his family that loaned money may cause. Instead, he did it the hard way, paying back a substantial loan from another party over a mere twelve months.

But that was all a while ago and today Cedusizi and his young company, Top Technics, are enjoying the fruits that diligent labour and commitment bring.

"The day I left school in 2007 I joined my brother, Thulani Khumalo, who worked as a supervisor for a forestry company here in Eswatini, in the forest working as a general labourer," Cedusizi says. "This taught me a lot and I learnt about hard work

before embarking on tertiary study in electrical engineering a year later."

Cedusizi qualified as an electrical and electronics engineer from the Eswatini College of Technology in 2012 at the end of a three-year course.

In his first permanent position he worked as an office clerk for six months before his employer realised that, given his previous

experience in forestry, he was being under-utilised. He then became the operations manager for the company's silviculture division where he stayed for three years. "While serving this company I learnt a lot about hard work, managing money and importantly, what makes a forestry business successful."

"After those three valuable years, I joined a silviculture contractor for a year at Usutu Forests," Cedusizi

continues. "It was around this time that I put into place plans to create my own company and Stephan Olivier, the Project Manager for Peak Timbers Limited at that time, gave me that opportunity when he tasked me to salvage all timber left over from a devastating fire that had swept through the Piggs Peak area in 2016."

But employing even only 15 manual labourers called for immediate cash flow and considering that he'd have a period of at least two months with no immediate income, Cedusizi faced a financial crisis. Nonetheless the brother of a friend looked at his business plan, cash flow predictions and general enthusiasm and decided, after much discussion, to loan him the money he needed for start-up. This substantial amount though had to be paid back within 12 months, which was also the length of his first probationary contract from his clients.

"I managed to pay back that loan over 12 months in 2018 and now had the benefit of a positive credit score with the bank, which would stand me in good stead going

forward," he says. "By 2019, I started the process to buy my first new Bell 225F Logger from Bell Equipment in Eswatini, which turned out to be the first machine of the new Bell F-series Logger range in the Piggs Peak area."

"I chose a Bell Logger because that is the only logger you see offering sustained service in our forests all over Eswatini. They just never seem to have an end and there are some very old machines around as well, which says a lot for the brand."

In 2020, he bought a Bell 225A Logger on the pre-owned market that had worked for 8 000 hours, feeling confident that should that machine need a further overhaul, it would be possible due to its sturdy design that made this feasible. This machine was followed six months later by another new Bell 225F Logger.

From salvaging burnt timber, Top Technics received a full commercial harvesting contract working in Eucalyptus when new owners took control of the timber

plantations in that area and Cedusizi could now properly plan for capital expenditure with longer contracts in place.

The year 2021 saw Cedusizi really expand his fleet of timber handling machines from Bell Equipment when he bought a third new Bell 225F Logger and a Skogger after receiving a contract that demanded increased production. These machines were ordered in October and delivered in November the same year.

"We generally harvest and extract during daylight hours only," Cedusizi explains. "We have six chainsaw teams felling the

Eucalyptus trees and the Skogger then extracts these full tree lengths to a roadside depot. Here a Bell Logger will be used to arrange these full tree lengths that are cross-cut to a variety of lengths, depending on the order and these vary from 2,4 metres to 14 metres. The Bell Logger then stacks the cut timber into various stacks determined by their lengths."

Cedusizi is full of praise for the difference the Skogger has made to his operations. "I'm grateful to Charlie Boucher of Bell Equipment in Matsapha for the valuable advice he gave me around the benefits of owning a

Skogger, especially from a safety point of view, a subject we take seriously," he adds. "Processing at roadside, where there is enough space to work safely, is now possible because of the Skogger's ability to extract the full tree lengths."

Cedusizi is considering adding a winch to the front of the Skogger for use in the steeper compartments that they encounter in the Piggs Peak area.

Although his fuel credit limits stipulate a maximum daily fuel consumption, neither the Bell 225F Loggers at 7 litres an hour or the Skogger at 7,5 litres an hour exceed this limit.

"It's reassuring to know that one can rely on Bell Equipment, which is not far away, for technical backup and servicing with a good

parts holding," Cedusizi says. "With the level of service that we get from Bell Equipment, I feel as if the mechanics, Russell Myburg and Christos Ginn, have been allocated to us exclusively."

The next piece of equipment Cedusizi plans to buy will be a 13-ton Excavator with a harvesting

head and he is taking a keen interest in the Kobelco SK135SR Excavator as a carrier. He also currently runs a used skidder and a 35-ton rigid timber truck that transports timber to mills and end users.
